# 1 Descripción del repositorio

- Directorio con archivos requeridos para ejecutar GADGET
- Directorio con archivos requeridos para ejecutar SS3
- Directorio con ejecutable SS3 para tres sistemas operativos (windows, linux y mac)
- Códigos Rmarkdown (pdf o html) que permita modificar archivos SS3
  - formato data.ss
  - formato contro.ss
  - formato starter.ss
  - formato forecast.ss

# 2 Descargar archivos requeridos desde repositorio

Tarea pendiente. . . .

# 3 Librerías requeridas

## 3.1 Identificamos los directorio de trabajo

```
#dirname.base <- here("10a_anchcadiz")
dirname.base <- here("modelos_SS3", "simple")
```

### 3.1.0.1 Creamos un nuevo directorio para la nueva versión del modelo modificado

```
dirname.mod <- here("boqueron_SS3")
dir.create(path=dirname.mod, showWarnings = TRUE, recursive = TRUE)
```

## 3.2 Leer los archivos de Stock Synthesis con la función SS\_read()

Cada uno de los archivos de entrada se lee en R como una lista.

Use names() para ver todos los componentes de la lista

```
inputs <- r4ss::SS_read(dir = dirname.base)
names(inputs)
## [1] "dir"      "path"     "dat"      "ctl"      "start"    "fore"     "wtatage"
## [8] "par"

#trabajaremos con archivo ctl
ctl<-inputs$ctl # archivo base
ctl1<-ctl # archivo modificado
```

## 3.3 Revisamos los nombres de los componentes de la lista del archivo control que deseamos modificar

```
#matrix(names(ctl1), ncol=1)
```

### 3.4 Especificaciones iniciales

```
#-----
ctl1$nseas      <- 4
ctl1$N_areas    <- 1
ctl1$Nages      <- 4
ctl1$Nsexes     <- 1
ctl1$Npopbins   <- 44
ctl1$Nfleets    <- 3
ctl1$Do_AgeKey  <- 0
ctl1$fleetnames <- c("Fishery","PELAGO","ECOCADIZ")
ctl1$Comments<-"#C 2023 Boqueron Cádiz control file MODELO TRIMESTRAL"
ctl1$eof        <- TRUE

### 3.5 Especificaciones del crecimiento

Opciones y especificaciones:

- EmpiricalWAA = 0 means do not read wtatage.ss; 1 means read and use wtatage.ss and also read and use growth parameters
- N\_GP = N\_Growth\_Patterns (Growth Patterns, Morphs, Bio Patterns, GP are terms used interchangeably in SS3)
- N\_platoon = N\_platoons\_Within\_GrowthPattern

```
#-----
ctl1$EmpiricalWAA <- 0
ctl1$N_GP          <- 1
ctl1$N_platoon     <- 1
#-----
# revisa salidas
ctl1[15:17]
## $EmpiricalWAA
## [1] 0
##
## $N_GP
## [1] 1
##
## $N_platoon
## [1] 1
#-----
```

### 3.6 Distribución del reclutamiento

Opciones y especificaciones:

- recr\_dist\_method = 2=main effects for GP, Area, Settle timing; 3=each Settle entity; 4=none (only when N\_GP $N_{settlepop}$ ==1)
- recr\_global\_area = 1=global; 2=by area
- recr\_dist\_read = number of recruitment settlement assignments
- recr\_dist\_inx = unused option

recr\_dist\_pattern es una Matriz que contiene la siguiente información:

- GPattern:
- month:
- area:
- age:

(for each settlement assignment)

```
#-----
ctl1$recr_dist_method<-3
ctl1$recr_global_area<-1
ctl1$recr_dist_read  <-1
ctl1$recr_dist_inx   <-0
```

```

ctl1[18:21]
## $recr_dist_method

##
## $recr_dist_read
## [1] 1
##
## $recr_dist_inx
## [1] 0

#-----
rec_pattern<-data.frame(row.names="recr_dist_pattern1",
                        "GPattern" = 1,
                        "month"    = 1,
                        "area"     = 1,
                        "age"      = 0)
ctl1$recr_dist_pattern<-rec_pattern
#-----
# revisa salidas
ctl1$recr_dist_pattern
##                GPattern month area age
## recr_dist_pattern1      1      1      1  0
#-----

```

### 3.7 Bloques

Opciones y especificaciones:

- N\_Block\_Designs =
- blocks\_per\_pattern =
- Block\_Design =

```

#-----
ctl1$N_Block_Designs    <- 1
ctl1$blocks_per_pattern <- 1
ctl1$Block_Design       <- c(1989,1989)
#-----
# revisa salidas

## $blocks_per_pattern
## [1] 1
##
## $Block_Design
## [1] 1989 1989
#-----

```

### 3.8 Parámetros que varían en el tiempo

Opciones y especificaciones:

- `time_vary_adjust_method` = controls for all timevary parameters. `_time-vary` parm bound check (1=warn relative to base parm bounds; 3=no bound check); Also see `env` (3) and `dev` (5) options to constrain with base bounds.
- `time_vary_auto_generation` = Matriz que contiene la siguiente información: AUTOGEN, autogen: 1st element for biology, 2nd for SR, 3rd for Q, 4th reserved, 5th for selex where: 0 = autogen time-varying parms of this category; 1 = read each time-varying parm line; 2 = read then autogen if parm min=-12345.

```
#-----
ctl1$time_vary_adjust_method <- 1
ctl1$time_vary_adjust_method
## [1] 1
#-----
# arreglo de datos para "time_vary_auto_generation"
time_auto<-data.frame(matrix(rep(1,5),nrow=1,ncol=5))
colnames(time_auto)<-paste("time_vary_auto_generation_",seq(1,5,1),sep="")

ctl1$time_vary_auto_generation<-time_auto
ctl1$time_vary_auto_generation
##   time_vary_auto_generation_1 time_vary_auto_generation_2
## 1                             1                             1
##   time_vary_auto_generation_3 time_vary_auto_generation_4
## 1                             1                             1
##   time_vary_auto_generation_5
## 1                             1
#-----
```

### 3.9 Parámetros biológicos

Opciones y especificaciones:

- `natM_type`: 0=1Parm;1=N\_breakpoints;2=Lorenzen;3=agespecific;4=agespec\_withseasinterpolate; 5=BETA;\_Maunder\_link\_to\_maturity;6=Lorenzen\_rangeno additional input for selected M option; read 1P per morph
- `GrowthModel`: 1= vonBert with L1&L2; 2=Richards with L1&L2; 3=age\_specific\_K\_incr; 4=age\_specific\_K\_decr; 5=age\_specific\_K\_each; 6=NA; 7=NA; 8=growth cessation
- `Growth_Age_for_L1`: Age(post-settlement)\_for\_L1;linear growth below this
- `Growth_Age_for_L2`: 999 to use as Linf
- `Exp_Decay`: exponential decay for growth above maxage (value should approx initial Z; -999 replicates 3.24; -998 to not allow growth above maxage)
- `Growth_Placeholder`: placeholder for future growth feature
- `N_natMparms`:
- `SD_add_to_LAA`: SD\_add\_to\_LAA (set to 0.1 for SS2 V1.x compatibility)
- `CV_Growth_Pattern`: 0=(CV=f(LAA)); 1=(CV=F(A)); 2=(SD=F(LAA)); 3=(SD=F(A)); 4=(logSD=F(A))
- `maturity_option`: 1=length logistic; 2=age logistic; 3=read age-maturity matrix by growth\_pattern; 4=read age-fecundity; 5=disabled; 6=read length-maturity
- `First_Mature_Age`:
- `fecundity_option`: (1)eggs=Wt(a+bWt); (2)eggs=aL^b; (3)eggs=aWt^b; (4)eggs=a+bL; (5)eggs=a+bW
- `hermaphroditism_option`: 0=none; 1=female-to-male age-specific fxn; -1=male-to-female age-specific fxn
- `parameter_offset_approach`: 1- direct, no offset\*\*; 2- male=fem\_parmexp(male\_parm); 3: male=femaleexp(parm) then old=young\*exp(parm)

El siguiente código permite modificar las opciones antes especificadas:

```

#-----
ctl1$natM_type      <- 0
ctl1$GrowthModel    <- 1

### 3.9.1 Parámetros biológicos

La función principal del archivo de control es definir los parámetros que utilizará el modelo. A continuación se indican las líneas de parámetros biológicos que serán modificadas:

```
row.names(ctl$MG_parms)
## [1] "NatM_p_1_Fem_GP_1" "L_at_Amin_Fem_GP_1" "L_at_Amax_Fem_GP_1"
## [4] "VonBert_K_Fem_GP_1" "CV_young_Fem_GP_1" "CV_old_Fem_GP_1"
## [7] "Wtlen_1_Fem_GP_1" "Wtlen_2_Fem_GP_1" "Mat50%_Fem_GP_1"
## [10] "Mat_slope_Fem_GP_1" "Eggs_alpha_Fem_GP_1" "Eggs_beta_Fem_GP_1"
## [13] "NatM_p_1_Mal_GP_1" "L_at_Amin_Mal_GP_1" "L_at_Amax_Mal_GP_1"
## [16] "VonBert_K_Mal_GP_1" "CV_young_Mal_GP_1" "CV_old_Mal_GP_1"
## [19] "Wtlen_1_Mal_GP_1" "Wtlen_2_Mal_GP_1" "RecrDist_GP_1"
## [22] "RecrDist_Area_1" "RecrDist_month_1" "CohortGrowDev"
## [25] "FracFemale_GP_1"
```

La definición de cada línea es la siguiente:

- **NatM\_p\_1\_Fem\_GP\_1** = Mortalidad natural para el patrón de crecimiento de hembras (Fem) 1, donde el número de parámetros de mortalidad natural depende de la opción seleccionada.
- **L\_at\_Amin\_Fem\_GP\_1** = Longitud en Amin (unidades en cm) para hembra, patrón de crecimiento 1.
- **L\_at\_Amax\_Fem\_GP\_1** = Longitud en Amax (unidades en cm) para hembra, patrón de crecimiento 1.
- **VonBert\_K\_Fem\_GP\_1** = Coeficiente de crecimiento de von Bertalanffy (las unidades son por año) para las hembras, patrón de crecimiento 1.
- **CV\_young\_Fem\_GP\_1** = variabilidad para el tamaño a la edad  $\leq$  Amin para las hembras, patrón de crecimiento 1. Tenga en cuenta que CV no puede variar con el tiempo, por lo que no figure env-link o un vector de desviación. Además, las unidades son como CV o como desviación estándar, dependiendo del valor asignado del patrón CV.
- **CV\_old\_Fem\_GP\_1** = variabilidad para el tamaño a la edad  $\geq$  Amax para las hembras, patrón de crecimiento 1. Para edades intermedias, haga una interpolación lineal de CV en el tamaño medio a la edad. Tenga en cuenta que las unidades para CV dependerán del patrón CV y del valor del parámetro mortalidad-crecimiento como compensación. El valor del CV no puede variar con el tiempo.
- **Wtlen\_1\_Fem\_GP\_1** = coeficiente para convertir la longitud en cm en peso en kg para las hembras.
- **Wtlen\_2\_Fem\_GP\_1** = exponente en convertir la longitud a peso para hembras.
- **Mat50%\_Fem\_GP\_1** = inflexión logística de madurez (en cm o años) donde la madurez femenina en logitud (o edad) es una función logística.
- **Mat\_slope\_Fem\_GP\_1** = pendiente logística (debe tener valor negativo).
- **Eggs\_alpha\_Fem\_GP\_1** = parámetros de fecundidad. El uso depende de la opción de fecundidad seleccionada.
- **Eggs\_beta\_Fem\_GP\_1**

Cada línea de parámetro biológicos contiene la siguiente información:

```
names(ctl$MG_parms)
## [1] "LO" "HI" "INIT" "PRIOR" "PR_SD"
## [6] "PR_type" "PHASE" "env_var&link" "dev_link" "dev_minyr"
## [11] "dev_maxyr" "dev_PH" "Block" "Block_Fxn"
```

La definición de cada línea es la siguiente:

- LO = un valor mínimo para el parámetro
- HI = un valor máximo para el parámetro
- INIT = valor inicial para el parámetro. Si la fase (descrita a continuación) para el parámetro es negativa, el parámetro se fija en este valor. Si se lee el archivo ss.par, sobrescribe estos valores INIT.
- PRIOR = valor esperado para el parámetro. Este valor se ignora si el PR\_type es 0 (no prior) o 1 (symmetric beta). Si PR\_type es lognormal (descrito a continuación).
- PR\_SD = desviación standar de la PRIOR, utilizado para calcular la likelihood del valor del parámetro actual. Este valor es ignorado si la PR\_type es 0.
- PR\_type = tipo de distribución de error del valor esperado:
  - 0 = ninguno
  - 1 = symmetric beta
  - 2 = full beta
  - 3 = lognormal sin ajuste de sesgo
  - 4 = lognormal con ajuste de sesgo
  - 5 = gamma, y
  - 6 = normal.
- PHASE = fase en la que se empieza a estimar el parámetro. Un valor negativo hace que el parámetro conserve su valor INIT (o valor leído del archivo ss.par)
- env\_var&link = crea un vinculo a una serie temporal ingresada al archivo de datos
- dev\_link = invoca el uso del vector de desviación en la función linkage
- dev\_minyr= año de inicio del vector de desviación
- dev\_maxyr= año final para el vector de desviación
- dev\_PH = fase de estimación para elementos en el vector de desviación
- Block = bloque de tiempo o tendencia a aplicar
- Block\_Fxn= forma funcional para el desplazamiento de bloques

### 3.9.1.0.1 Mortalidad natural Fem GP\_1

```
##-----
MG_parms1<-data.frame(row.names="NatM_p_1_Fem_GP_1",
                      "LO"      = 0.05,
                      "HI"      = 1.6,

### 3.11 Desvíos de los reclutamientos y sesgo

- **do\_recdev:** 0=none; 1=devvector ( $R=F(SSB)+dev$ ); 2=deviations ( $R=F(SSB)+dev$ ); 3=deviations ( $R=R0*dev$ ;  $dev2=R-f(SSB)$ ); 4=like 3 with  $sum(dev2)$  adding penalty
- **MainRdevYrFirst:** first year of main recr\_devs;early devs can preceed this era
- **MainRdevYrLast:** last year of main recr\_devs; forecast devs start in following year
- **recdev\_phase:**
- **recdev\_adv:** (0/1) to read 13 advanced options
- **recdev\_early\_start:** (0=none; neg value makes relative to recdev\_start)
- **recdev\_early\_phase:**
- **Fcast\_rec\_rphase:** (incl. late recr) (0 value resets to maxphase+1)
- **lambda4Fcast\_recr\_like:** lambda for Fcast\_recr\_like occurring before endyr+1
- **last\_early\_yr\_nobias\_adj:** last\_yr\_nobias\_adj\_in\_MPD; begin of ramp

- `first_yr_fullbias_adj`: `first_yr_fullbias_adj_in_MPD`; begin of plateau
- `last_yr_fullbias_adj`: `last_yr_fullbias_adj_in_MPD`
- `first_recent_yr_nobias_adj`: `end_yr_for_ramp_in_MPD` (can be in forecast to shape ramp, but SS3 sets `bias_adj` to 0.0 for fcast yrs)
- `max_bias_adj`: `max_bias_adj_in_MPD`; (typical ~0.8; -3 sets all years to 0.0; -2 sets all non-forecast yrs w/ estimated recdevs to 1.0; -1 sets `biasadj`=1.0 for all yrs w/ recdevs).
- `period_of_cycles_in_recr`: period of cycles in recruitment (N parms read below)
- `min_rec_dev`:
- `max_rec_dev`:
- `N_Read_recdevs`:

```

### 3.12 Mortalidad por pesca

- `F_ballpark`: F ballpark value in units of `annual_F`

- `F_ballpark_year`: F ballpark year (neg value to disable)
- `F_Method`: 1=Pope midseason rate; 2=F as parameter; 3=F as hybrid; 4=fleet-specific parm/hybrid (#4 is superset of #2 and #3 and is recommended)
- `maxF`: max F (methods 2-4) or harvest fraction (method 1)
- `F_iter`: N iterations for tuning in hybrid mode; recommend 3 (faster) to 5 (more precise if many fleets)

```
#-----

## 3.14 Selectividad

### 3.14.1 tipos de selectividad a la talla

- Pattern:\_0; parm=0; selex=1.0 for all sizes
- Pattern:\_1; parm=2; logistic; with 95% width specification
- Pattern:\_5; parm=2; mirror another size selex; PARMS pick the min-max bin to mirror
- Pattern:\_11; parm=2; selex=1.0 for specified min-max population length bin range
- Pattern:\_15; parm=0; mirror another age or length selex
- Pattern:\_6; parm=2+special; non-parm len selex
- Pattern:\_43; parm=2+special+2; like 6, with 2 additional param for scaling (average over bin range)
- Pattern:\_8; parm=8; double\_logistic with smooth transitions and constant above Linf option
- Pattern:\_9; parm=6; simple 4-param double logistic with starting length; parm 5 is first length; parm 6=1 does desc as offset
- Pattern:\_21; parm=2+special; non-parm len selex, read as pairs of size, then selex
- Pattern:\_22; parm=4; double\_normal as in CASAL
- Pattern:\_23; parm=6; double\_normal where final value is directly equal to sp(6) so can be >1.0
- Pattern:\_24; parm=6; double\_normal with sel(minL) and sel(maxL), using joiners
- Pattern:\_2; parm=6; double\_normal with sel(minL) and sel(maxL), using joiners,back compatible version of 24 with 3.30.18 and older
- Pattern:\_25; parm=3; exponential-logistic in length
- Pattern:\_27; parm=special+3;cubic spline in length;parm1==1 resets knots;parm1==2 resets all
- Pattern:\_42; parm=special+3+2;cubic spline;like 27, with 2 additional param for scaling (average over bin range)
- discard\_options:\_0=none;\_1=define\_retention;\_2=retention&mortality;\_3=all\_discarded\_dead;\_4=define\_dome-shaped\_retention

```

```

### 3.14.2 tipos de selectividad a la edad

- Pattern:\_0; parm=0; selex=1.0 for ages 0 to maxage
- Pattern:\_10; parm=0; selex=1.0 for ages 1 to maxage
- Pattern:\_11; parm=2; selex=1.0 for specified min-max age
- Pattern:\_12; parm=2; age logistic
- Pattern:\_13; parm=8; age double logistic. Recommend using pattern 18 instead.
- Pattern:\_14; parm=nages+1; age empirical
- Pattern:\_15; parm=0; mirror another age or length selex
- Pattern:\_16; parm=2; Coleraine - Gaussian
- Pattern:\_17; parm=nages+1; empirical as random walk N parameters to read can be overridden by setting special to non-zero
- Pattern:\_41; parm=2+nages+1; // like 17, with 2 additional param for scaling (average over bin range)
- Pattern:\_18; parm=8; double logistic - smooth transition
- Pattern:\_19; parm=6; simple 4-param double logistic with starting age
- Pattern:\_20; parm=6; double\_normal,using joiners
- Pattern:\_26; parm=3; exponential-logistic in age
- Pattern:\_27; parm=3+special; cubic spline in age; parm1==1 resets knots; parm1==2 resets all
- Pattern:\_42; parm=2+special+3; // cubic spline; with 2 additional param for scaling (average over bin range)
- Age patterns entered with value >100 create Min\_selage from first digit and pattern from remainder

```
